Example 28: (S)-2-Methyl-butyric acid (S)-(3S,4aS,7S,8S,8aS)-8-[(3R,5R)-6-(3,4-dimethoxy-benzylcarbamoyl)-3,5-dihydroxy-hexyl]-3,7-dimethyl-decahydro-naphthalen-1-yl ester

a) To a solution of 40 g (0.098 mol) of mevinolin in 3 l ethyl acetate is added 10 g Pt/Al₂O₃. The mixture is hydrogenated under an H₂ atmosphere under 2.6 bar pressure for 16 h. The mixture is filtered and the solvent evaporated. The residue is purified by silical gel chromatography using ethyl acetate/cyclohexane 8/2 as a solvent. First eluted is the undesired cis isomer, followed by a side product with one double bond. Finally the desired trans isomer is eluted. Several crystallizations yielded the desired trans tetrahydro-mevinolin ((S)-2-Methyl-butyric acid (S)-(3S,4aS,7S,8S,8aS)-8-[(2R,4R)-4-hydroxy-6-oxo-tetrahydro-pyran-2-yl]-3-methyl-7-methyl-decahydro-naphthalen-1-yl ester).

b) To a solution of 2 g (5.0 mmol) of the trans tetrahydro mevinolin obtained in a) in 12 ml ethanol is added 3.7 ml (25.0 mmol) 3,4-dimethoxybenzylamine. The reaction mixture is stirred for 20 h at rt, then it is diluted with 300 ml diethyl ether with and washed with 100 ml of water. The organic extract is dried with $MgSO_4$ and evaporated. The residue is purified by chromatography on silicagel using ethyl acetate as eluent to give the title compound.

**Both diastereoisomers are obtained and each can be isolated.

The synthesis of compounds of Examples 61 to 64* additionally comprise a treatment with ethyl diazoacetate and rhodium acetate, followed for the compounds of Examples 62* and 63*, by a reduction.

Example 65:

MS (ESI): 558 [M+H]⁺

Compounds of Ex. 66 and 67 may be obtained from mevinolin as follows: ester cleavage of mevinolin and oxidation of the newly generated hydroxy position to the oxo compound. The neighbouring hydroxy substituent is then introduced via the formation of the silylenolate and treatment with meta-chloroperbenzoic acid. Selective alkylation of the newly formed hydroxy position is achieved by treatment with Meerwein salt. The ester group is introduced via its anhydride. Then the procedure as described for Ex. 34 is followed.

The compounds of formula I, in free form or in pharmaceutically acceptable salt form exhibit valuable pharmacological properties, e.g. inhibiting activity of LFA-1/ICAM-1 or ICAM-3 interactions or inhibiting inflammation, e.g. as indicated in in vitro and in vivo tests and are therefore indicated for therapy.

A. In vitro:

i) **Cell Free Assay**

The assay measures the binding of soluble human ICAM-1 to immobilized human LFA-1. LFA-1 is purified from JY cells, a human lymphoblastoid B cell-line, by immunoaffinity chromatography as described by Dustin *et al.* (J. Immunol. 148, 2654-2663, 1992). ICAM-1 mouse Cx fusion protein (ICAM-1) is produced using the baculovirus system as described by Weltz-Schmidt *et al.* (Anal. Biochem. 238, 184-190, 1996).

Purified LFA-1 is diluted 1:20 in phosphate buffer and saline (PBS) containing 2 mM MgCl₂, pH 7.4 and coated onto microtitre plates (Nunc) at 37°C for 3h. Plates are blocked with 1% heat-treated BSA in PBS for 2 hours at 37°C followed by a washing step using PBS, 2 mM MgCl₂, 1% fetal calf serum, pH 7.4 (assay buffer). Compounds dissolved at 10 mM in DMSO are diluted in assay buffer and added to the plates. Biotinylated recombinant ICAM-1 in assay buffer (6 µg/ml) is added and allowed to bind at 37°C for one hour. After incubation, wells are washed with assay buffer. Streptavidin-peroxidase diluted 1:5000 in assay buffer is added and incubated for 45 min at 37°C. Plates are then washed with assay buffer and 2,2'-azino-bis(3-ethylbenzothiazoline-6 sulfonic acid) diammonium salt substrate solution is added to each well. The reaction is stopped after 20 min and bound ICAM-1 is determined by measuring the optical density at 405 nm in a microplate reader.

In this assay, compounds of formula I inhibit adhesion of LFA-1 to ICAM-1 with an IC₅₀ ≤ 30 µM, preferably 0.05 to 30 µM.

ii) Human Mixed Lymphocyte Reaction (MLR)

Peripheral blood mononuclear cells (PBMC) are isolated from human buffy coats. In each experiment, PBMC from three different donors (A, B, and C) are set up in three individual 2-way reactions (A-B, A-C, B-C). Cells are cocultured for six days and proliferation is determined by pulsing the cells with ³H-thymidine. The concentration of compounds of formula I which results in 50% inhibition of cell proliferation (IC₅₀) is calculated. In this assay, compounds of formula I inhibit the MLR with an IC₅₀ in the range of 0.2 to 4 µM.

B. In vivo

i) Murine Thioglycollate Induced Peritonitis

Thioglycollate is injected i.p. to mice and immediately thereafter the compound to be tested is given s.c.. The mice are killed after 4 hours, the peritoneal cavity lavaged and total number of neutrophils in the lavage fluid is determined.

In this assay, the compounds of formula I inhibit thioglycollate induced neutrophil migration when administered s.c. at a dose of from 0.001-50 µg/kg.

ii) Allergic Contact Dermatitis (ACD)

Groups of oxazolone-sensitized mice are challenged with 10 µl of 0.2 or 2.0% oxazolone on the inner surface of the right to elicitate ACD. The low concentration of oxazolone is used for testing compounds on systemic activity whereas the high concentration is applied for topical testing. The unchallenged left ears serve as normal controls and dermatitis is evaluated from the individual differences in pinnal weight, which is taken as a measure of increase in inflammatory swelling 24 h after the challenge. Dermatitis is evaluated in test- and for comparison in control groups. The test groups are treated with the test compounds either orally (twice, 2 h and immediately before challenge), subcutaneously (immediately before challenge) or topically (30 min after challenge at the site of elicitation of the ACD); the controls are treated similarly with the vehicles alone. For oral and subcutaneous administration the compounds are administered in an oil in water emulsion, for topical administration the compounds are prepared in a mixture of ethanol, acetone and dimethylacetamide. The data of the test- and the vehicle-treated control groups are statistically analysed by ANOVA followed by Dunnet T-test (normal distribution of data) or by H and U-test, respectively. When administered p.o. at a dose of from 0.1 to 10 mg/kg, compounds of formula I inhibit the elicitation phase of allergic contact dermatitis.

iii) Transplantation: Heterotopic mouse heart allograft

The strain combination used: BALB/c => C3H (H-2d => H-2k) comprises MHC and non-MHC mismatch. Female animals are anaesthetised using inhalational isoflurane. Following heparinisation of the donor BALB/c mouse through the abdominal inferior vena cava with simultaneous exsanguination via the aorta, the chest is opened and the heart rapidly cooled. The aorta is ligated and divided distal to the first branch and the brachiocephalic trunk is divided at the first bifurcation. The left pulmonary artery is ligated and divided and the right side divided but left open. All other vessels are dissected free, ligated and divided and the donor heart is removed into iced saline.

The recipient C3H is prepared by dissection and cross-clamping of the infra-renal abdominal aorta and vena cava. The graft is implanted with end-to-side anastomoses, using 11/0 monofilament suture, between the donor brachiocephalic trunk and the recipient aorta and the donor right pulmonary artery to the recipient vena cava. The clamps are removed, the graft tethered retroabdominally, the abdominal contents washed with warm saline and the animal is closed and allowed to recover under a heating lamp. Graft survival is

monitored by daily palpation of the beating donor heart through the abdominal wall. Rejection is considered to be complete when heart beat stops. Improvements of graft function are obtained in animals treated with a compound of formula I administered orally at a daily dose of 30 mg/kg. Significant improvement is obtained when the compound of formula I is administered with an immunosuppressive agent, e.g. cyclosporin A, at a daily dose of 10 mg/kg.

The compounds of formula I are, therefore, useful in the treatment and/or prevention of diseases or disorders mediated by LFA-1/ICAM-1 or ICAM-3 Interactions e.g. ischemia/reperfusion injury e.g. myocardial infarction, stroke, gut ischemia, renal failure or hemorrhage shock, acute or chronic rejection of organ or tissue allo- or xenografts, e.g. heart, lung, combined heart-lung, kidney, liver, bowel, bone marrow or pancreatic islets, infection diseases such as septic shock, adult respiratory distress syndrome, or traumatic shock. The compounds of formula I are also useful in the treatment and/or prevention of acute or chronic inflammatory diseases or disorders or autoimmune diseases e.g. rheumatoid arthritis, systemic lupus erythematosus, hashimoto's thyroiditis, multiple sclerosis, myasthenia gravis, diabetes type I and uveitis, cutaneous manifestations of immunologically-mediated illnesses, inflammatory and hyperproliferative skin diseases (such as psoriasis, atopic dermatitis, alopecia areata, allergic contact dermatitis, irritant contact dermatitis and further eczematous dermatitises, seborrhoeic dermatitis, lichen planus, pemphigus, bullous pemphigoid, epidermolysis bullosa, urticaria, angioedemas, vasculitides, erythema multiforme, cutaneous eosinophilias, lupus erythematosus, acne, granuloma annulare, pyoderma gangrenosum, sun burns or toxic epidermal necrolysis), inflammatory bowel disease, ophthalmic inflammatory diseases or immune-mediated conditions of the eye, such as auto-immune diseases, e.g. keratoplasty and chronic keratitis, allergic conditions, e.g. vernal conjunctivitis, inflammatory conditions and corneal transplants. Compounds of formula I are useful as immunosuppressive agents.

For the above uses the required dosage will of course vary depending on the mode of administration, the particular condition to be treated and the effect desired. In general, satisfactory results are indicated to be obtained systemically at daily dosages of from about 0.1 to about 10 mg/kg body weight. An indicated daily dosage in the larger mammal is in the

range from about 0.5 mg to about 80 mg, conveniently administered, for example, in divided doses up to four times a day or in retard form.

For topical use satisfactory results are obtained with local administration of a 1-3 % concentration of active substance several times daily, e.g. 2 to 5 times daily.

The compounds of formula I may be administered systemically or topically, by any conventional route, in particular enterally, e.g. orally, e.g. in the form of tablets or capsules, topically, e.g. in the form of lotions, gels, ointments or creams, or in a nasal or a suppository form. Percutaneous administration via patches or other delivery systems may also be a possible route for prevention or treatment of above diseases.

Pharmaceutical compositions comprising a compound of formula I in association with at least one pharmaceutical acceptable carrier or diluent may be manufactured in conventional manner by mixing with a pharmaceutically acceptable carrier or diluent. Unit dosage forms contain, for example, from about 0.1 mg to about 40 mg of active substance.

Topical administration is e.g. to the skin. A further form of topical administration is to the eye.

The compounds of formula I may be administered in free form or in pharmaceutically acceptable salt form e.g. as indicated above. Such salts may be prepared in conventional manner and exhibit the same order of activity as the free compounds.

In accordance with the foregoing the present invention further provides:

- 1.1 A method for preventing or treating disorders or diseases mediated by LFA-1/ICAM-1 interactions, e.g. such as indicated above, in a subject in need of such treatment, which method comprises administering to said subject an effective amount of a compound of formula I or a pharmaceutically acceptable salt thereof;
- 1.2 A method for preventing or treating acute or chronic inflammatory diseases or disorders or autoimmune diseases, e.g. as indicated above, in a subject in need of

such treatment, which method comprises administering to said subject an effective amount of a compound of formula I or a pharmaceutically acceptable salt thereof;

2. A compound of formula I, in free form or in a pharmaceutically acceptable salt form for use as a pharmaceutical, e.g. in any of the methods as indicated under 1.1 and 1.2 above.
3. A pharmaceutical composition for use in any of the methods as in 1.1 and 1.2 above comprising a compound of formula I in free form or pharmaceutically acceptable salt form in association with a pharmaceutically acceptable diluent or carrier therefor.
4. A compound of formula I or a pharmaceutically acceptable salt thereof for use in the preparation of a pharmaceutical composition for use in any of the method as in 1.1 and 1.2 above.

The compounds of formula I may be administered as the sole active ingredient or in conjunction with, e.g. as an adjuvant to, other drugs in immunomodulating regimens or other anti-inflammatory agents for the treatment or prevention of allo- or xenograft acute or chronic rejection or inflammatory or autoimmune disorders. For example, the compounds of formula I may be used in combination with cyclosporins, rapamycins or ascomycins, or their immunosuppressive analogs, e.g. cyclosporin A, cyclosporin G, FK-506, ABT-281, ASM981, rapamycin, 40-O-(2-hydroxy)ethyl-rapamycin etc.; corticosteroids; cyclophosphamide; azathioprene; methotrexate; FTY720; leflunomide; mizoribine; mycophenolic acid; mycophenolate mofetil; 15-deoxyspergualine; immunosuppressive monoclonal antibodies, e.g., monoclonal antibodies to leukocyte receptors, e.g., MHC, CD2, CD3, CD4, CD7, CD25, CD28, B7, CD40, CD45 or CD58 or their ligands; or other immunomodulatory compounds, e.g. CTLA4Ig, or other adhesion molecule inhibitors, e.g. mAbs or low molecular weight inhibitors including Selectin antagonists and VLA-4 antagonists. A preferred composition is with Cyclosporin A, FK506, rapamycin or 40-O-(2-hydroxy)ethyl-rapamycin.

Where the compounds of formula I are administered in conjunction with other immunosuppressive / immunomodulatory or anti-inflammatory therapy, e.g. for preventing or

treating chronic rejection as hereinabove specified, dosages of the co-administered immunosuppressant, immunomodulatory or anti-inflammatory compound will of course vary depending on the type of co-drug employed, e.g. whether it is a steroid or a cyclosporin, on the specific drug employed, on the condition being treated and so forth. In accordance with the foregoing the present invention provides in a yet further aspect:

5. A method as defined above comprising co-administration, e.g. concomitantly or in sequence, of a therapeutically effective amount of a compound of formula I in free form or in pharmaceutically acceptable salt form, and a second drug substance, said second drug substance being an immunosuppressant, immunomodulatory or anti-inflammatory drug, e.g. as indicated above.
6. A therapeutic combination, e.g. a kit, for use in any method as defined under 1.1 or 1.2 above, comprising a compound of formula I, in free form or in pharmaceutically acceptable salt form, with at least one pharmaceutical composition comprising an immunosuppressant, immunomodulatory or anti-inflammatory drug. The kit may comprise instructions for its administration.

Compounds of Examples 2, 28 and 34 are preferred, particularly for use in the treatment of inflammatory skin diseases, e.g. as indicated above. In one test run, following results were obtained: an IC_{50} of 0.05, 0.79 and 0.19 μ M, respectively for the compounds of Ex. 2, 28 and 34, in the test A(i); an IC_{50} of 0.2 μ M for the compound of Ex. 2 in the MLR test A(ii); an ED_{50} of 0.1 μ g/kg p.o. for the compound of Ex. 2 in the test B(i); in B(ii) compound of Ex. 2 has an inhibiting effect of 41% when administered p.o. at a dose of 2 x 3 mg/kg and compound of Ex. 34 inhibits inflammatory swelling by 41% at 2x 1 mg/kg p.o.

Preferred compounds of formula I are those inhibiting HMG CoA Reductase activity with an $IC_{50} \geq 1 \mu$ M, e.g. $\geq 50 \mu$ M, in the in vitro Microsomal assay as disclosed in WO 99/11258.
